3rd homework documentation

My implementation of InputDialog window:

Every element of this window has different kind of anchors, so that the change of the size of the window, will not affect the usability or readability of the program

My main window looks like this:

On the left side of the window I used listView, the upper right part is just a panel and the bottom right side is TextBox with the multiline property,

I chose to use the columns to display name and size of the file.

When we press button Ok after entering the Directory in Input Dialog, the program saves all the information about the files (name, size, etc.) in the list view. It is implanted in `miOpenToolStripMenuItem_Click` method

Every other aspect of program is done accordingly to the previous lab
